

Main Problems encountered;

Code perspective;

1. One of the jobs required for this week was to configure the graph which was supposed to get information from the server side. However, this was a bit of an issue as it needed all the information from the friends page. It also was a bit difficult as most videos online were only giving information about graphing while manually inputting data.
2. There were also some issues with merging all of the fixes into the development branch.
3. The database was also returning errors locally, which meant that this issue was taking longer than expected.

Team perspective;

1. This week was also pretty good in terms of the fact that all of the tasks were clearly distributed and everyone knew exactly what to do.
2. One issue was the fact that not everyone could be there for the weekly meeting on friday. While this wasn't a major issue, this caused some slight issues when it came to releasing all the documents on time.

Reflection;

1. This was the last week of pure code, and now we are focusing mainly on getting the draft out and making sure it is perfect. One positive aspect is that we already started working on it.
